THE BEHOLDER PROJECT
Volume I

BEYOND PARAMETER SCALING

A First-Principles Theory of Emergent Machine Intelligence

Parameter scaling built the machines that changed the world. This book asks the next question: is bigger the only axis?

Volume I of The Beholder Project proposes a falsifiable research program - an ecology of agents, validators, contradiction-preserving synthesis, and evolutionary selection - built around a fixed neural core. Grounded in real published work (FunSearch, AlphaEvolve, XLand, paraconsistent belief revision), with pre-registered metrics, refutation conditions, and a mathematical appendix. No hype. No claims of consciousness. A research program that invites you to break it.

"Do not believe it. Build it."
"Measure it. Break it. Improve it."
